CMPx example: Suppose that a dasetil, a lentum, and a vifali are competing to be this year's batalit. The dasetil is the most likely to become the batalit, followed closely by the lentum, with the vifali trailing way behind. Since these are the only competitors, if the lentum isn't the batalit, then if the dasetil isn't the batalit, the vifali will be. Since the dasetil is ahead, the lentum most likely won't be the batalit. Does it follow that it's likely that, if the dasetil isn't the batalit, the vifali will be?
